

Memo To: Carlyn Prisk, USEPA
 From: Daston Corporation
 Date: February 7, 2003
 RE: Addendum #1 to (b) (7)(A)

Interview Summary

On February 7, 2003, ^{Nonresponsive based on revised scope} of Tri-State Enterprise contacted (b) (7)(A) (b) (7)(A) (WITNESS) at his residence by telephone at (b) (7)(A). This contact was made to clarify information he had provided to me during my in person interview with him on January 4, 2003. Specifically, the clarification involved the color of the liquid that was discharged from the Jordan Chemical Company plant into the stream located behind the plant.

I advised the WITNESS that my notes indicated that this liquid was red, but that I had also noted in my notes that he had indicated a white substance was also observed in the stream. I asked the WITNESS to reiterate his knowledge of waste discharges from the Jordan Chemical Company plant into the stream located behind the plant.

The WITNESS explained that there were two sources of liquid waste discharges from the Jordan Chemical Company plant into the stream located behind the plant.

The WITNESS reiterated that the primary discharge into this stream was a red liquid coming from a pipe from the Jordan Chemical Company plant into the stream. He stated that this liquid waste would turn the stream a red color.

The WITNESS stated that the Jordan Chemical Company also stored numerous 55-gallon steel drums in the rear parking lot of the Jordan Chemical Company plant. He estimated that there were more than 50 drums stacked outside on the parking lot and that he had observed that many of these drums leaked.

The WITNESS stated that there was a large storm drain at the far end of the rear parking lot at the Jordan Chemical Company plant. The WITNESS stated that he had observed the liquid leaking from these drums flow into the storm drain. The WITNESS stated that this storm drain emptied into a sewage pipe that eventually emptied into the same stream as the red liquid discharge from the plant. The WITNESS stated that much of the leaking liquid was a white slurry and that he observed this white slurry in the stream. The WITNESS described the drums as black 55-gallon steel drums. He could not recall if the drums had any markings on them.

When asked how he knew that the storm drain emptied into the sewage pipe that emptied into the stream, the WITNESS stated that he had played in the sewage pipe and had observed the liquid from the Jordan Chemical Company storm drain empty into the sewage pipe. The WITNESS further stated that this storm drain ended at the stream and was above ground at the stream. The WITNESS reiterated that this stream emptied into Darby Creek at the base of the Folcroft Landfill. The WITNESS stated that he had followed the stream to its destination numerous times.
